LAB #4: Biological Membranes I.

INTRODUCTION Membranes are another molecule that make life possible. Most importantly, they provide a compartment for cells, separating the cytoplasm (the material within a cell), with its multitude of molecules and structures, from the outside

4.1: Membrane Structure and
Composition Since most cells live in an
aqueous environment and the contents
of the cell are also mostly aqueous, it
stands to reason that a membrane that

In addition to the three factors noted above, phospholipid composition can

also alter membrane fluidity: shorter acyl chains lead to greater fluidity, while longer chains, with more surface area for interaction, generate membranes with higher viscosity. The phospholipid composition of biological membranes is dynamic and can vary widely.

Biological membranes allow life as we know it to exist. They form cells and enable separation between the inside and outside of an organism, controlling by means of their selective permeability which substances enter and leave. By allowing gradients of ions to be created across them, membranes also enable

Membranes - 2nd Edition

A biological membrane, biomembrane or cell membrane is a selectively permeable membrane that separates cell from the external environment or creates intracellular compartments. Biological membranes, in the form of eukaryotic cell membranes, consist of a phospholipid bilayer with

Biological membrane - Wikipedia

-A small cell has a small surface area relative to volume, which allows efficient transport through the plasma membrane. -A small cell size occupies
