Tidal flow usually dominates in intertidal areas, but in exposed shallow areas, the wind can profoundly alter the tidal circulation. The flow field in the tidal channels of a tidal basin can be considered to consist of a large-scale part that varies depending on the scale of the entire basin, and a small-scale part that varies more locally.

The commonly twice-a-day flooding and drainage largely defines the character and composition of sediments of the intertidal zone. Sediments are supplied through nearby delta distributaries, by the erosion of headlands, from the adjacent sea floor, and,

Although tidal-flat deposits have been studied extensively over several decades, most studies were focused on embayment and estuary tidal flats, where wave energy is typically low. In contrast, studies of open-coast tidal flats, which differ significantly from the embayment and estuary tidal flats, are scarce.

This broad definition also includes fjords, lagoons, river mouths, and tidal creeks. An estuary is a dynamic ecosystem having a connection to the open sea through which the sea water enters with the rhythm of the tides. The seawater entering the estuary is diluted by the fresh water flowing from rivers and streams. The pattern of dilution varies between different estuaries and depends on the volume of freshwater, the tidal range, and the extent of evaporation of the water in the estuary.

### Estuary - Wikipedia

On the annual scale, Lesourd et al. (2003) have shown that subtidal deposits in the Bay of the Seine occur when flooding (flow > 1200 m<sup>3</sup> • s<sup>-1</sup>) induces the expulsion of the TM from the estuary. During low river flow, sediment deposits are redistributed according to tidal range and ocean swell periods.

Most tidal swamp is in highly sheltered areas where tidal wetlands predated the Hudson River railroads, on dredge spoil deposits between the railroad and mainland, or at stream mouths, between islands and the mainland, and in protected coves. The largest examples are at Mill Creek, Stockport Flats, Rogers Island, Rams Horn Creek, and Tivoli Bays.
